

**APPARATUS AND METHOD FOR DISPLAYING A TELEVISION
VIDEO SIGNAL IN A MOBILE TERMINAL**

PRIORITY

This application claims priority to an application entitled “APPARATUS
5 AND METHOD FOR DISPLAYING TELEVISION VIDEO SIGNAL IN MOBILE
TERMINAL”, filed in the Korean Intellectual Property Office on September 17,
2002 and assigned Serial No. 2002-56641, the contents of which are incorporated
herein by reference.

BACKGROUND OF THE INVENTION

10 **1. Field of the Invention**

The present invention relates to a display apparatus and method for a mobile
terminal, and more particularly to an apparatus and method for receiving and
displaying a television video signal in a mobile terminal.

2. Description of the Related Art

15 The present trend in mobile terminals is to provide a high-speed data transfer
function as well as a voice communication function. That is, mobile terminals can
conduct high-speed data communication over an International Mobile
Telecommunications 2000 (IMT 2000) mobile communication network, in addition
to voice communication. The data may be, for example, packet data and image

data.

Such a mobile terminal has a display unit, the size of which has been increasing. The mobile terminal may display picture data or pixel data received from a base station, or process image data captured by a camera. The mobile
5 terminal may also receive and display a television video signal. In this case, the mobile terminal must additionally have a television receiving function and be able to perform a wireless communication function simultaneously with or independently of the processing of a television signal.

SUMMARY OF THE INVENTION

10 Therefore, it is an object of the present invention to provide an apparatus and method which can display a television video signal in a mobile terminal with a wireless communication function.

It is another object of the present invention to provide an apparatus and method which can display a television video signal in a mobile terminal and display
15 menus for control of the displayed video signal in an on-screen display (OSD) manner.

It is a further object of the present invention to provide an apparatus and method which can configure a television video signal display area and an OSD menu display area individually in a mobile terminal to display a television video
20 signal and OSD menus in the corresponding display areas, respectively.

It is yet another object of the present invention to provide an apparatus and

method which can configure buffer areas for storage of a television video signal and OSD user data individually in a mobile terminal to rapidly display the television video signal and OSD user data.

BRIEF DESCRIPTION OF THE DRAWINGS

5 The above and other objects, features and other advantages of the present invention will be more clearly understood from the following detailed description taken in conjunction with the accompanying drawings, in which:

 FIG. 1 is a block diagram illustrating an example of the construction of a mobile terminal for displaying a television video signal according to an embodiment
10 of the present invention;

 FIG. 2 is a block diagram illustrating an example of connections between a control unit and a television receiver configuration in FIG. 1 according to an embodiment of the present invention;

 FIG. 3 is a detailed block diagram illustrating an example of a video
15 processing unit in FIGS. 1 and 2 according to an embodiment of the present invention;

 FIG. 4 is a timing diagram illustrating an example of operating characteristics between the control unit and the video processing unit in FIGS. 2 and 3 according to an embodiment of the present invention;

20 FIG. 5 is a diagram illustrating an example of a television video signal display area of a display unit in FIG. 1 according to an embodiment of the present invention;

 FIG. 6 is a block diagram illustrating an example of the configurations of a

keypad and the display unit in FIG. 1 according to an embodiment of the present invention;

FIG. 7 is a flow chart illustrating an example of a method for displaying a television video signal according to the embodiment of the present invention
5 according to an embodiment of the present invention;

FIG. 8 illustrates examples of display states of the display unit when a television picture is scaled up and rotated in FIG. 7 according to an embodiment of the present invention;

Figs. 9 illustrates examples of display states of the display unit when a
10 television picture is captured in FIG. 7 according to an embodiment of the present invention;

FIG. 10 is a block diagram illustrating examples of menus provided in a television picture display state in FIG. 7 according to an embodiment of the present invention; and

15 FIGS. 11A and 11B illustrate examples of display states of the display unit when a menu service is provided in FIG. 7 according to an embodiment of the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

FIG. 1 is a block diagram illustrating an example of a mobile terminal
20 according to an embodiment of the present invention, which is preferably a mobile telephone.

With reference to FIG. 1, the mobile telephone comprises a radio frequency (RF) unit 21 for performing wireless communication for the mobile telephone. The

RF unit 21 includes an RF transmitter (not shown) for up-converting the frequency of a signal to be transmitted and amplifying the resulting signal, and an RF receiver (not shown) for low-noise amplifying a received signal and down-converting the frequency of the resulting signal. A data processor 23 includes a transmitter (not shown) for encoding and modulating the signal to be transmitted, and a receiver (not shown) for demodulating and decoding the received signal. That is, the data processor 23 is implemented with a modulator/demodulator (modem) and a coder/decoder (codec). An audio processor 25 functions to reproduce a received audio signal from the data processor 23, or transfer a transmit audio signal from a microphone to the data processor 23.

A keypad 27 includes keys for inputting numeric and character information, and function keys for setting various functions. The keypad 27 further includes keys for setting various modes for the processing of a television video signal according to the embodiment of the present invention. A memory unit 29 includes a program memory (not shown) and a data memory (not shown). The program memory stores programs for control of a general operation of the mobile telephone and programs for the processing of a television video signal according to the embodiment of the present invention. The data memory functions to temporarily store data generated during execution of the programs stored in the program memory.

A control unit 10 functions to control the entire operation of the mobile telephone. The control unit 10 may include the data processor 23. In the embodiment of the present invention, the control unit 10 sets a video processing unit 70 to a television mode set through the keypad 27 and controls it to display a television video signal received in the set television mode.

A tuner 50 functions to receive a television video signal of a channel selected under the control of the control unit 10 and perform a frequency conversion operation with respect to the received television video signal. A decoder 60 functions to demodulate and decode an output television video signal from the tuner 50. That is, the decoder 60 decodes the television video signal from the tuner 50 to output red (R), green (G) and blue (B) color signals and synchronous signals (a horizontal synchronous signal and a vertical synchronous signal). The video processing unit 70 is in data communication with the control unit 10 and performs a signal processing function of displaying an output television video signal received from the decoder 60 under the control of the control unit 10. The video processing unit 70 also functions to process the television video signal from the decoder 60 and user data from the control unit 10 and output the processed results respectively to corresponding areas of a display unit 80. The user data preferably includes a current time, a battery level indicator, a reception sensitivity, etc. The user data also includes data regarding a changed state of the television mode. The video processing unit 70 processes and outputs the television video signal from the decoder 60 on a frame basis, separately from the user data.

The display unit 80 displays output data from the control unit 10 in a communication mode and displays output television video data and user data from the video processing unit 70 respectively to the corresponding areas in the television mode. In the television mode, the display unit 80 displays the television video data from the video processing unit 70 in a first display area and the user data therefrom in a second display area, respectively. The display unit 80 may preferably employ a liquid crystal display (LCD). In this case, the display unit 80 includes the

following which are not shown a LCD controller, a memory for storing image data, and an LCD. When the LCD is implemented as a touch screen, it may comprise an input unit together with the keypad 27.

The operation of the mobile telephone with the television picture display
5 function will hereinafter be described with reference to FIG. 1. Firstly, in the communication mode, if a user pushes a send key after dialing a telephone number via the keypad 27, the control unit 10 detects the key input, processes received dialed information through the data processor 23 and then converts/outputs the processed result into an RF signal through the RF unit 21. Thereafter, if a called
10 party generates a response signal, the control unit 10 receives the generated response signal through the RF unit 21 and data processor 23 and then establishes a voice call path through the audio processor 25, thereby allowing the user to communicate with the called party. In an incoming call mode, the control unit 10 detects the incoming call mode through the data processor 23 and generates a
15 ringing signal through the audio processor 25. If the user responds to an incoming call, then the control unit 10 detects the call response and establishes a voice call path through the audio processor 25 to perform the communication function of connecting the parties. Although the voice communication function has been disclosed as an example to be performed in the outgoing and incoming call modes,
20 a data communication function may also be performed in the same modes to transmit and receive packet data and image data. In a standby mode or text communication mode, the control unit 10 processes text data through the data processor 23 and displays the processed text data on the display unit 80.

Secondly, a description will be given of the operation of the mobile

telephone in the television mode with reference to FIG. 2, which shows a television receiver configuration according to an embodiment of the present invention, in the construction of FIG. 1.

With reference to FIG. 2, if the user selects the television mode, the control
5 unit 10 notifies the video processing unit 70 of the television mode selection. Then,
the video processing unit 70 outputs control data for channel selection to the tuner
50 and drives the decoder 60. The tuner 50 tunes to a channel corresponding to the
channel selection control data from the video processing unit 70, receives a
television video signal over the tuned channel, performs a frequency conversion
10 operation with respect to the received television video signal and outputs the
resulting television video signal to the decoder 60. The decoder 60 decodes the
television video signal from the tuner 50 to output an analog RGB video signal and
synchronous signals (horizontal and vertical synchronous signals). That is, the
decoder 60 functions to separate and output color signals from a received composite
15 video signal. The decoder 60 is preferably of an National Television System
Committee (NTSC) type.

The video processing unit 70 receives the television video signal containing
the RGB video signal and synchronous signals from the decoder 60, appends user
data to the received television video signal and displays it on the display unit 80
20 along with the television video signal. At this time, the user data can be generated
directly from the control unit 10. In an embodiment of the present invention, the
user data may be generated from the video processing unit 70 under the control of
the control unit 10. The user data is preferably displayed on the television video
signal in an on-screen display (OSD) manner. The video processing unit 70

receives the analog RGB television video signal, converts it into digital data through an analog to digital (A/D) converter (ADC) therein and outputs the converted digital data to the display unit 80. The video processing unit 70 displays the user data generated from the control unit 10 or internally generated under the control of the control unit 10 in the OSD manner. The video processing unit 70 also functions to capture a displayed television picture and perform a block copy operation with respect to the OSD data.

In this embodiment, the user data is assumed to be generated from the control unit 10. In the following description, the user data is referred to as OSD data. Also, the OSD data has a smaller number of colors than those of the television video signal. In addition, in this embodiment, the television video data is assumed to have 65536 colors and the OSD data is assumed to have 4096 colors.

Tables 1A through 1E show a register map according to an embodiment of the present invention, wherein registers are accessed by the control unit 10. In table 1, W represents a write only register command from the control unit 10 to the video processing unit 70. It is insignificant for the control unit 10 to read a register associated with the write only register command. R represents a read only register command from the control unit 10 to the video processing unit 70. The control unit 10 cannot change the contents of a register associated with the read only register command, which is a protected register. R/W represents a readable/writable register command from the control unit 10 to the video processing unit 70. In order to access a specific one of the register commands as in table 1, the control unit 10 sets a most significant bit MA16 of the corresponding address to 0 and lower-order bits MA[15:0] of that address to address bit values corresponding to the specific register

command, respectively. On the other hand, in order to access user data in the video processing unit 70, the control unit 10 addresses by setting a most significant bit MA16 of the corresponding address to 1.

FIG. 3 is a detailed block diagram illustrating an example of the video processing unit 70 in Figs. 1 and 2, and FIG. 4 shows a data access timing between the control unit 10 and the video processing unit 70.

The operation of the video processing unit 70 will hereinafter be described with reference to Figs. 3 and 4. An A/D converter 111 converts an analog RGB signal received from the decoder 60 into digital data. In the embodiment of the present invention, the A/D converter 111 is assumed to convert the analog RGB signal into 18-bit digital RGB data (65536 colors).

A format scaler 113 receives the digital RGB data from the A/D converter 111 and a horizontal synchronous signal HSYNC and vertical synchronous signal VSYNC from the decoder 60 and scales the size of the received digital RGB data on the basis of the received synchronous signals. The format scaler 113 performs its scaling operation in the following manner. Firstly, the format scaler 113 determines a display picture size. Secondly, the format scaler 113 sets VXSIZE and VYSIZE of the display picture size with regard to the horizontal and vertical directions. In the embodiment of the present invention, the television video signal is assumed to be scaled within the range of the maximum size of 176*220 pixels to the minimum size of 100*75 pixels. Thirdly, the format scaler 113 sets a scaling

(up/down) ratio. Fourthly, the format scaler 113 calculates $720 \times 4096 / \text{VXSIZE}$ with respect to the horizontal direction and sets the calculated result as HLSR. The format scaler 113 also calculates $240 \times 2048 / \text{VYSIZE}$ with respect to the vertical direction and sets the calculated result as VLSR. In the embodiment of the present invention, the input video signal is assumed to be scaled to the maximum size of 176×220 pixels. Further, the scaler 113 converts the 18-bit RGB data into 16-bit RGB data. The 16-bit data [15:0] is preferably composed of 5-bit R data [15:11], 6-bit G data [10:5] and 5-bit B data [4:0].

Memories 131, 133 and 135 each store data of a frame size ($176 \times 220 \times 12$ bits). In the television mode, the memory 131 functions to store user data and the memories 133 and 135 function to store video data. In the communication mode, the memories 131 and 133 function to store user data and the memory 135 functions to store wall paper data.

A memory controller 123 functions to control access to the memories 131, 133 and 135 under the control of the control unit 10. The memory controller 123 controls the memories 131, 133 and 135 separately according to the television mode and the communication mode of the device. In the television mode, the memory controller 123 stores user data from the control unit 10 in the first memory 131. The memory controller 123 also stores video data of the current frame from the scaler 113 in the second memory 133 (or the third memory 135) and outputs video data of the previous frame stored in the third memory 135 (or the second memory 133). The memory controller 123 stores/outputs television RGB video data in/from the memories 133 and 135 on a frame basis. When storing video data of the current frame in the memory 133, the memory controller 123 outputs video data of the

previous frame stored in the memory 135. When storing video data of the current frame in the memory 135, the memory controller 123 outputs video data of the previous frame stored in the memory 133. Namely, when accessing the memories 133 and 135, the memory controller 123 outputs stored previous frame data when
5 storing received frame data, in order to process a television video signal in real time. In other words, because 30 frames per second must be processed for the television video signal display, the memory controller 123 sends the video signal to the display unit 80 in real time using the two frame memories. The memory controller 123 outputs frame video data to the display unit 80 in a frame period
10 (vertical synchronous signal period) and user data stored in the memory 131 to the display unit 80 in an idle period before the start of the next frame, respectively. As a result, the memory controller 123 outputs frame video data stored in the memory 133 or 135 in a video signal active period (one vertical synchronous signal period) of a one-frame video signal display period and user data stored in the memory 131
15 in an idle period of the display period, respectively.

In the communication mode, the memory controller 123 accesses user data in the memories 131 and 133 and wall paper data in the memory 135, respectively. At this time, both of the memories 131 and 133 need not be used, and only one thereof may be set and used.

20 An OSD mixer 125 mixes frame-unit video data from the memory controller 123 with user data therefrom as OSD data and outputs the mixed result to the display unit 80.

A control interface 117 interfaces user data and mode control data between

the control unit 10 and the video processing unit 70. In the embodiment of the present invention, the control interface 117 interfaces a 17-bit address and 16-bit data with the control unit 10. A frame memory in the video processing unit 70 is accessed if a most significant bit A16 of the 17-bit address is 1, and a register in the video processing unit 70 is accessed if it is 0. With reference to FIG. 4 for output of data to the video processing unit 70, the control unit 10 selects the video processing unit 70 as indicated by 211 and enables a write mode as indicated by 213. The control unit 10 then outputs an address MA[16:0] as indicated by 217, and user data MD[15:0] as indicated by 219 to the video processing unit 70 to write the user data into a memory location of the video processing unit 70 corresponding to the address. The user data may include current time data, battery level data, reception sensitivity data, television picture control data, mode setting control data, menu data, etc. For access to data from the video processing unit 70, the control unit 10 selects the video processing unit 70 as indicated by 221 and enables a read mode as indicated by 225. The control unit 10 then outputs an address MA[16:0] as indicated by 227 to the video processing unit 70 to access user data MD[15:0] as indicated by 229 from a memory location of the video processing unit 70 corresponding to the address. The control interface 117 performs such an interfacing function that the output of the control unit 10 can be processed by the video processing unit 70 as shown in FIG. 4.

An Inter Integrated Chip (I2C) bus interface 115 has an I2C bus master capable of controlling two slave devices. The I2C interface 115 controls the tuner 50 and decoder 60 under the control of the control interface 117.

An OSD controller (or OSD random access memory (RAM) block copy

accelerator) 119 copies a desired rectangular area of user data to a desired position.

That is, the OSD controller 119 can block-copy a desired rectangular area of data to a desired position according to control data from the control unit 10, transferred by the control interface 117. This block copy function can be performed either in
5 one memory or between two memories. In other words, in the television mode, the block copy function can be performed only in the memory 131. In the OSD mode, the block copy function can be performed in the memory 131, in the memory 133 or between the memories 131 and 133.

The OSD controller 119 can perform the OSD block copy operation in the
10 following manner. The control unit 10 sets various parameters for the block copy operation and outputs the set parameters to the OSD controller 119. The set parameters are BC_SEL0 and BC_SEL1 indicative of memories to be copied, BCX1 and BCY1 indicative of the left and upper coordinates of a rectangular area to be copied, BCX2 and BCY2 indicative of the right and lower coordinates of the
15 rectangular area to be copied, BCDX and BCDY indicative of X/Y-copy displacements, and BCDXSIG and BCDYSIG indicative of X/Y-copy displacement directions. The block copy operation is executed. In this case, if BC_START is set to 1, the OSD controller 119 can execute the block copy operation according to the set parameters. During the block copy operation, BC_BUSY is set to 1, thus
20 inhibiting the access to the above memories by the control unit 10.

On the basis of the register commands from the control unit 10 as in table 1, as described above, the video processing unit 70 performs a display mode setting function, a display output switching function, a power control function for the memories 131, 133 and 135, an OSD control function, a wall paper setting function,

an access memory selection function for the control unit 10, an RGB data inversion function, a block copy function, a screen capture function, a display position adjustment function for the display unit 80, a television (TV) picture rotation function, a TV picture display start position adjustment function, a TV picture scaling function, a brightness/contrast adjustment function and an I2C communication function.

The video processing unit 70 performs a bit allocation function for color expression in the following manner. TV video data from the A/D converter 111 and wall paper data are expressed in 16 bits/pixel. The 16-bit data [15:0] has a bit configuration as in table 2.

【Table 2】

| Color | Data | Bit |
|-------|-------------|--------|
| Red | data[15:11] | 5 bits |
| Green | data[10:5] | 6 bits |
| Blue | data[4:0] | 5 bits |

Also, OSD data is expressed in 12 bits. The 12-bit data [11:0] has a bit configuration as in table 3.

【Table 3】

| Color | Data | Bit |
|-------|------------|--------|
| Red | data[11:8] | 4 bits |
| Green | data[7:4] | 4 bits |
| Blue | data[3:0] | 4 bits |

The video processing unit 70 performs the display mode setting function in the following manner. The video processing unit 70 enters the TV mode if the

register command TV_MODE is 1 and the OSD mode if it is 0. When the operation mode is the TV mode, the video processing unit 70 utilizes the memory 131 as an OSD memory for access to user data and the memories 133 and 135 as frame memories for access to TV video data, respectively. When the operation mode is the OSD mode, the video processing unit 70 utilizes the memories 131 and 133 as OSD memories for access to user data and the memory 135 as a wall paper memory, respectively. In this case, user data stored in the memory 131 as the OSD memory and user data stored in the memory 133 as the OSD memory cannot be displayed at the same time, and any one thereof is selected according to the register command DISP_SEL.

The video processing unit 70 performs the display output switching function in the following manner. If the register command VIDEOON is 1, the video processing unit 70 displays a video picture on the display unit 80. If the register command VIDEOON is 0, the video processing unit 70 outputs synchronous signals, but outputs a picture of only one color (black) in place of the video picture. In the case where the register command OSDON is 1, the video processing unit 70 displays an OSD picture. However, the video processing unit 70 displays no OSD picture if the register command OSDON is 0. In addition, the video processing unit 70 displays a TV picture if the register command TVON is 1 and a picture of only one color (black) in place of the TV picture if it is 0.

The frame memory power control function is performed in the following manner. The memories 131, 133 and 135 are powered on/off by the register commands RAM0PON, RAM1PON and RAM2PON, respectively. If each register command is set to 1, the corresponding memory is powered on to be available.

However, if each register command is set to 0, the corresponding memory is powered off.

The video processing unit 70 performs the OSD control function in the following manner. In the OSD control function, the video processing unit 70 can
5 select an OSD picture in response to the register command DISP_SEL in the OSD mode (TV_MODE = 0). The video processing unit 70 displays the contents of the memory 131 as an OSD picture if the register command DISP_SEL is set to 0, and the contents of the memory 133 as an OSD picture if it is set to 1. Also, when the register command WP_DISP is set to 1 in the OSD mode, the video processing unit
10 70 accesses the contents of the memory 135 and displays the accessed contents as a wall paper. When the register command WP_DISP is set to 0, the video processing unit 70 displays a black picture.

The video processing unit 70 performs the wall paper setting function, more particularly the transparent color setting function, in the following manner. When
15 displaying OSD data and TV video data or wall paper data in an overlap manner, the video processing unit 70 uses a transparent color for the OSD data. To this end, when the OSD data is data set to the register command THRUPTN, the color thereof is processed to be transparent. Where the color of the OSD data is transparent, a TV picture or wall paper is displayed at the corresponding position.
20 The transparent color is valid when the register command THRUEN is 0. If the register command THRUEN is 1, the video processing unit 70 displays an OSD picture of a color designated by the OSD data.

The access memory selection function for the control unit 10 is performed

in the following manner. The control unit 10 can access a memory for OSD by outputting a most significant bit (MSB) MA16 of an address as 1. The access is made to an OSD memory location designated by lower-order bits MA15-MA0 of the address. The accessible memory is selectable according to the register command

5 RW_SEL. The control unit 10 can access the memories 131, 133 and 135, respectively, using the register command RW_SEL = 0, 1 and 2 in the OSD mode. However, in the TV mode (TV_MODE = 1), the control unit 10 can directly access only the memory 131. For TV picture capture, the control unit 10 can read a TV picture from the memory 133 or 135, but not select the memories 133 and 135. In

10 this case, the video processing unit 70 automatically selects a memory for output of a full TV picture and outputs captured data from the selected memory to the control unit 10.

The video processing unit 70 performs the RGB data inversion function in the following manner. If the register command RGBINV is set to 1, the video

15 processing unit 70 inverts the color of OSD data by means of bit inversion and displays the inverted OSD data color. If the register command RGBINV is set to 0, the video processing unit 70 displays the color of OSD data as it is.

The video processing unit 70 performs the OSD block copy function in the following manner. The block copy function is performed by the OSD controller 119

20 in the video processing unit 70 in response to the associated register commands from the control unit 10. The OSD controller 119 can block-copy a desired rectangular area of data to a desired position. This block copy function can be performed either in one memory or between two memories. In the TV mode (TV_MODE = 1), the block copy function can be performed only in the memory

131. In the OSD mode (TV_MODE = 0), the block copy function can be performed in the memory 131, in the memory 133 or between the memories 131 and 133. In order to perform the block copy function, the control unit 10 first sets register commands or parameters for the block copy operation and the OSD controller 119
5 then executes the block copy operation according to the set parameters. The set parameters for the block copy operation are BC_SEL0 indicative of a source memory in which data to be block-copied is stored, BC_SEL1 indicative of a destination memory in which the block-copied data is to be stored, BCX1 and BCY1 indicative of the left and upper coordinates of a rectangular area of the source
10 memory, BCX2 and BCY2 indicative of the right and lower coordinates of the rectangular area of the source memory, BCDX and BCDY indicative of X/Y-copy displacements, and BCDXSIG and BCDYSIG indicative of X/Y-copy displacement directions. If the control unit 10 sets BC_START to 1 after setting the parameters for the block copy operation in the above manner, then the OSD controller 119
15 executes the block copy operation according to the set parameters. During the block copy operation, BC_BUSY is set to 1, thus inhibiting the access to the above memories by the control unit 10.

The video processing unit 70 performs the TV picture capture function in the following manner. In the TV picture capture function, the video processing unit 70
20 can capture video data of a TV picture being displayed and output the captured video data to the control unit 10. This TV picture capture function is valid only in the TV mode (TV_MODE = 1). The TV picture capture operation is executed as follow. First, the control unit 10 sets the register command RW_SEL to 0 and, during display of a TV picture, sets the register command TV_STOP to 1. As a
25 result, the video processing unit 70 stops the TV picture display. Under the

condition that the video processing unit 70 stops the TV picture display, the control unit 10 reads current video data from a corresponding memory to capture it. If the control unit 10 sets the register command TV_START to 1 after capturing the TV picture, then the video processing unit 70 resumes the TV picture display.

5 The video processing unit 70 performs the display position adjustment function for the display unit 80 in the following manner. The display position of the display unit 80 can be finely adjusted on the basis of the register commands YADJ and XADJ. The register commands YADJ and XADJ are each composed of 4 bits, which are expressed by a two's complement. The register command YADJ ranges
10 from +7 to -2, wherein the sign "-" represents the upward direction and "+" represents the downward direction. The register command XADJ ranges from +1 to -8, wherein the sign "-" represents the left direction and "+" represents the right direction.

 The video processing unit 70 performs the TV picture rotation function in
15 the following manner. The video processing unit 70 can rotate a TV picture being displayed. The TV picture rotation function is enabled by setting the register command TV_ROT to a desired value. In the case of TV_ROT = 0, 1, 2 and 3, the video processing unit 70 rotates a TV picture being displayed, respectively, by 0°, 90°, 180° and 270° or substantially 0°, substantially 90°, substantially 180° and
20 substantially 270°.

 The video processing unit 70 performs the TV picture display start position adjustment function in the following manner. The video processing unit 70 can make a relative display position adjustment of an input analog RGB signal to

synchronous signals. With regard to the horizontal direction, the video processing unit 70 can adjust the actual display position from a downward position of HSYNC by adjusting the register command TVHPOS although it has the initial value of 124.

The smaller the register command TVHPOS, the closer the actual display position is to the downward position of HSYNC. Similarly, the video processing unit 70 can adjust the actual display position with regard to the vertical direction by adjusting the register command TVVPOS.

The video processing unit 70 performs the TV picture brightness/contrast adjustment function in the following manner. The video processing unit 70 can adjust the brightness and contrast of a TV picture being displayed, respectively, by setting the register commands BRIGHT and CONTRAST to desired values. The register command BRIGHT is 6 bits long, which are expressed by a two's complement. The register command CONTRAST is composed of a positive integer. By setting the register commands BRIGHT and CONTRAST to desired values, the video processing unit 70 can perform the following calculation with respect to respective RGB signals being displayed.

$$\text{LCD OUTPUT} = (\text{TV INPUT} + \text{BRIGHT}) * \text{CONTRAST} / 128$$

The video processing unit 70 performs the TV picture scaling function in the following manner. This scaling function is performed by the format scaler 113 in the video processing unit 70. The scaler 113 executes the scaling operation in the following order. Note that register settings which are described below are given in consideration of horizontality and verticality when the TV picture stays at 0° or substantially 0°, irrespective of rotation of the TV picture. Firstly, the format scaler

113 sets a desired display picture size. Namely, the scaler 113 sets VXSIZE and VYSIZE of the desired display picture size with regard to the horizontal and vertical directions, which size is 100*75 pixels at minimum. Secondly, the scaler 113 sets a display start position. Namely, the scaler 113 sets the display start position of the
5 TV picture with TV_XPOS and TV_YPOS. Thirdly, the format scaler 113 sets a scaling (up/down) ratio. At this time, the scaler 113 calculates $720*4096/VXSIZE$ with respect to the horizontal direction and sets the calculated result as HLSR. The format scaler 113 also calculates $240*2048/VYSIZE$ with respect to the vertical direction and sets the calculated result as VLSR.

10 The above-described video processing functions, other than the block copy function and scaling function, are performed by the memory controller 123 in the video processing unit 70 on the basis of the associated register commands from the control unit 10.

FIG. 5 shows display areas of the display unit 80 in FIG. 1. The display unit
15 80 has a first display area 81 for displaying TV video data in the TV mode and a second display area 83 for displaying user data in the TV mode. The first display area 81 displays a TV picture of a quarter common intermediate format (QCIF) size from the memory 133 or 135 and the second display area 83 displays user data from the memory 131. The display unit 80 further has a third display area 85 for guiding
20 soft keys. In the embodiment of the present invention, the display areas of the display unit 80 are assumed to have their respective sizes as shown in FIG. 5. The QCIF picture has a size of 176*144 pixels and is displayed in the first display area 81 in the normal state. A full picture displayed on the entire screen of the display unit 80 has a size of 176*220 pixels.

In FIG. 5, the second display area 83 displays user data and sub-menus and has a size of 60*176 pixels. If the entire size of the second display area 83 is set to font size (18*19 pixels)*3 rows, the total 60 character data (60 pixels) can be displayed in the second display area 83. In this case, provided that the size of three
5 character data is used for a margin, the total 57 character data will be able to be displayed in the second display area 83. Also, provided that user data and menu items are stored in the memory 131 according to the characteristics of the second display area 83, they will be able to be efficiently displayed in the TV mode.

FIG. 6 is a block diagram illustrating an example of configurations of the
10 keypad 27 and display unit 80 according to the embodiment of the present invention.

In the configuration of the keypad 27, a TV mode ON key 31 is used to set the mobile telephone to the TV mode. If the user clicks on a TV key for a long period of time in the standby mode, the control unit 10 determines the key input to
15 be a TV mode ON key input. A TV mode screen size key 33 is used to change the size and direction of a TV picture displayed on the display unit 80. If the user clicks on the TV key for a short period of time in the TV mode, the control unit 10 determines the key input to be a TV mode screen size key input. Although the embodiment of the present invention has been disclosed for illustrative purposes to
20 implement one TV key for the TV mode ON key operation and TV mode screen size key operation, individual keys may be used for the TV mode ON key operation and TV mode screen size key operation. When the user clicks on a confirm key or capture key under the condition that a TV picture is displayed in the TV mode, the control unit 10 determines the clicked key to be a TV mode capture key 35. A TV

mode menu key 37 functions to set the TV mode or adjust a channel, screen or timer under the condition that the TV mode is set.

According to the embodiment of the present invention, the keypad can be implemented as shown in table 4.

5

【Table 4】

| Key | Method | Function | Remark |
|------------------|-------------|---|------------------------|
| TV | long click | set (start) TV mode | |
| Menu | short click | display various menus related to TV function | soft key guide display |
| TV | short click | select TV picture size and display direction | no guide display |
| Confirm | short click | capture TV picture as still picture | soft key guide display |
| Navigation ◀▶ | | manually select channel | |
| Navigation ▲▼ | | select automatic channel | |
| Numeric | | select channel by channel number input | |
| Cancel | short click | return to upper menu | |
| Exit | short click | exit from TV mode and return to standby picture | |

FIG. 7 is a flow chart illustrating an example of a method for displaying a television video signal according to the embodiment of the present invention.

With reference to FIG. 7, the user can move the mobile telephone from the standby mode to the TV mode directly or through menu selection. Firstly, in order to set the TV mode directly, the user clicks on the TV key for a long period of time. Upon receiving the TV key input in the standby mode, the control unit 10 determines the received TV key input to be a TV mode setting input. Secondly, when the user clicks on the menu key, the control unit 10 sends user data corresponding to menus to the video processing unit 70 to display the menus on the display unit 80. Thereafter, if the user selects a TV watch menu from among the

menus displayed on the display unit 80, the controller 10 determines the TV watch menu selection to be a TV mode setting input. Here, the TV mode refers to a state where the TV receiver is in operation. Moreover, when the menu key is input under the condition that the TV mode is set in the above manner, the control unit 10
5 performs a control operation to display a selected menu while displaying a TV picture.

First, if the TV key is long-clicked in the standby mode, the control unit 10 detects the TV key input at step 711 and sets the TV mode at step 713. The control unit 10 then outputs a TV mode setting command to the video processing unit 70.
10 In response to the TV mode setting command, the video processing unit 70 sets the memory 131 as a memory for storage of user data and the memories 133 and 135 as frame memories for storage of TV video data, respectively, as stated previously. At step 715, the control unit 10 outputs control data for TV channel selection, which is then transferred to the tuner 50 via the control interface 117 and I2C bus
15 master. If there is no channel selected after the TV mode is set, the control unit 10 outputs channel control data to the tuner 50 to access a channel selected in the previous state.

The tuner 50 tunes to a selected channel, receives a television video signal over the tuned channel and performs a frequency conversion operation with respect
20 to the received television video signal. The decoder 60 decodes the television video signal from the tuner 50 to output an analog RGB video signal and synchronous signals. The A/D converter 111 converts the analog video signal from the decoder 60 into digital video data, and the format scaler 113 scales the size of the digital video data from the A/D converter 111 to a predetermined size. The memory

controller 123 stores user data from the control unit 10 in the memory 131. The memory controller 123 also outputs digital video data of the previous frame stored in the memory 135 or 133 at the same time that it stores video data of the current frame from the format scaler 113 in the memory 133 or 135. Upon completing the output of video data of one frame, the memory controller 123 outputs user data stored in the memory 131. That is, the memory controller 123 outputs frame video data in a video signal active period of a one-frame video signal display period and user data in an idle period of the display period, respectively. Thereafter, upon receiving video data of the next frame, the memory controller 123 outputs digital video data of the previous frame stored in the memory 133 or 135 at the same time as storing the received video data in the memory 135 or 133. Therefore, the memory controller 123 performs the write and read operations of the frame memories 133 and 135 at the same time, thereby making it possible to display a received video signal in real time.

As stated above, at step 717, the control unit 10 controls the video processing unit 70 to display received video data, and outputs user data corresponding to the received video data to the video processing unit 70 to display the user data. At this time, a television picture output from the video processing unit 70 is a QCIF picture. As a result, the display unit 80 displays, as shown in view A of FIG. 8, the QCIF picture in its first display area 81, user data in its second display area 83 and a soft key guide in its third display area 85, respectively.

Upon receiving a channel change key input at step 719 under the condition that the received TV video signal is displayed in the above manner, the control unit 10 changes the current channel to a new channel at step 715 and then repeats the above step 717. For channel change, under the condition that the TV mode is

executed, the user can input a desired channel number directly using numeric keys, or select a desired channel using left and right keys of the navigation key. In addition, for channel change in the menu mode, the user can select an automatic channel menu in the menu mode and then select a desired channel number using up
5 and down keys of the navigation key.

If the TV mode screen size key is input at step 721 under the condition that the received TV video signal is displayed, then the control unit 10 outputs a screen adjustment command to the video processing unit 70 at step 723 to adjust the size of a TV picture and rotate the TV picture. Here, the TV picture has any one of two
10 types of sizes, a full size (176*220) and a scaled-down size (QCIF size: 176*144), as described above. The picture rotation can be made by 0°, 90° or 270° or substantially 0°, or substantially 90° or substantially 270°. When the TV mode is started, a TV picture of the QCIF size, which is set as a default, is displayed as shown in view A of FIG. 8. If the TV key is short-clicked under the condition that
15 the TV picture is displayed as shown in view A of FIG. 8, the control unit 10 determines the TV key input to be a TV mode screen size key input and then commands the video processing unit 70 to rotate the TV picture by 90° or substantially 90° and display it at the full size, as shown in view B of FIG. 8. Thereafter, if the TV key is short-clicked again, the control unit 10 commands the
20 video processing unit 70 to rotate the TV picture by 270° or substantially 270° and display it at the full size, as shown in view C of FIG. 8. In the case where the TV key is short-clicked again under the condition that the TV picture is displayed as shown in view C of FIG. 8, the control unit 10 controls the video processing unit 70 to display the TV picture at the QCIF size as shown in view A of FIG. 8.

In the case of the QCIF-size picture as shown in view A of FIG. 8, it is effective to set various menus associated with the TV mode and execute a direct access function. However, in the case of the full-size picture (full size_90° or full size_270°) as shown in view B or C of FIG. 8, the control unit 10 commands the video processing unit 70 not to display user data. As a result, when the full-size picture is displayed, user data and soft key data are not displayed in the second display area 83 and third display area 85 of the display unit 80. This enables the user to view the full-size TV picture. Even though no menu key is displayed in the soft key guide display area, or the third display area 85, the control unit 10 provides the menu service if the user pushes the menu key on the keypad 27.

Where the TV mode capture key is input in the TV mode at step 725, the control unit 10 outputs a screen capture command to the video processing unit 70 at step 727. The TV mode capture key can be driven by selecting the confirm key on the keypad 27 or the capture key displayed in the soft key guide display area, or the third display area 85 of the display unit 80, as shown in FIG. 6. The screen capture function is performed to capture and store a TV picture being displayed in the TV mode as a still picture. The TV picture can be captured either when it is displayed at the QCIF size as shown in view A of FIG. 8 or when it is displayed at the full size as shown in view B or C of FIG. 8, but the captured picture must be stored at the QCIF size. The reason is to standardize the sizes of captured pictures into a data size necessary for setting of a wall paper of the terminal as shown in view A of FIG. 9. In an embodiment of the present invention, the sizes of captured pictures may be set to the full size.

If the user clicks on the capture key displayed in a right portion of the soft

key guide display area of the display unit 80 as shown in view A of FIG. 9 or the confirm key on the keypad 27 under the condition that the TV mode is executed, the control unit 10 determines the screen capture mode to be selected and then outputs the screen capture command to the video processing unit 70. In response to the screen capture command, the video processing unit 70 continuously accesses video data of the currently displayed frame to maintain the output thereof, so that the display unit 80 displays the output video data from the video processing unit 70 as a still picture. Video data of a TV picture, captured and displayed as a still picture in this manner, can be accessed by the control unit 10. That is, the control unit 10 can access video data output as a still picture by the video processing unit 70, give a name to the still picture and then store the still picture in the form of a photograph. The views A, B and C of FIG. 9 illustrate a procedure of storing a photograph acquired after capture. If the user clicks on the capture key when that a TV picture is displayed as shown in view A of FIG. 9., the TV picture is displayed as a still picture as shown in view B of FIG. 9. If the user clicks on the confirm key under the condition that the TV picture is displayed as the still picture as shown in view B of FIG. 9, the control unit 10 accesses and stores output video data from the video processing unit 70 as shown in view C of FIG. 9. When the picture to be stored after capture is displayed as shown in view B of FIG. 9, the control unit 10 displays names set as defaults (for example, photograph 1, photograph 2, photograph 3, ...) in the second display area 83 of the display unit 80, which state is a character input waiting state. In this state, the user can input a photograph name in the second display area 83 in Korean or English. In an embodiment of the present invention, if there is no separate name input from the user, the control unit 10 may store the still picture with any one of the names set as the defaults. If the user clicks on the confirm key under the condition of inputting a photograph name after TV picture

capture, the control unit 10 displays on the display unit 80 the fact that the current picture is being stored, as shown in view C of FIG. 9. If the photograph storage is ended, then the control unit 10 returns to the above step 717 to perform the TV picture display function.

- 5 The user can perform various functions by selecting various menus while the received television video signal is displayed in the TV mode as described above. If the user clicks on the menu key at step 729, the control unit 10 displays menus at step 731. Thereafter, the control unit 10 provides a service of a function associated with one of the displayed menus selected by the user and then returns to
- 10 the above step 717.

- FIG. 10 shows functions and menus of keys for provision of function services in the TV mode. First, if the user clicks on the menu key, main menu items of the mobile telephone are displayed. If a TV menu item is selected from among the displayed menu items, menu items "TV watch" and "stored photograph view"
- 15 are displayed as shown in FIG. 10. When the TV watch menu item is selected, menu items "automatic channel", "screen adjustment" and "automatic off timer" are displayed. When the stored photograph view menu is selected, menu items "name change", "current photograph delete" and "all photograph delete" are displayed.

- If the menu key input is generated in the TV mode (where either a QCIF
- 20 screen or full screen can be displayed), the control unit 10 commands the video processing unit 70 to display a QCIF screen on the display unit 80. Then, the video processing unit 70 outputs video data at the QCIF size, outputs menu items to the second display area 83 and displays soft keys in the third display area 85, as shown

in FIGS. 11A and 11B. FIG. 11A shows a menu screen in the TV mode and FIG. 11B shows a menu screen in a stored photograph display mode.

With reference to FIG. 11A, whenever the menu key is clicked one time in the TV mode, a selectable menu item among the menu items in the second display area 83 is displayed with a different color from that of the others, and also in a
5 central portion of the third display area 85. The current time is displayed in an upper left portion of the first display area 81 and a channel number of a selected picture is displayed in an upper right portion thereof. This current time and channel number can be provided by the block copy function which is performed by the OSD
10 controller 119 as stated previously. If a select key is clicked under the condition that the menu items are displayed as shown in FIG. 11A, the control unit 10 proceeds to the next step to execute a function of the selected menu item.

With reference to FIG. 11B, in the stored photograph display mode, a stored photograph is displayed in the first display area 81 in place of a TV picture. If the
15 menu key is clicked, sub-menus are displayed on the menu screen of the second display area 83. Also, soft keys are displayed in the third display area 85 and a photograph name is displayed in an upper portion of the first display area 81. Similarly, the photograph name can also be provided by the block copy function.

As an alternative, the user may select a desired menu item on each of the
20 menu screens as shown in FIGS. 11A and 11B by inputting a numeric key. If the mobile telephone returns to the TV mode after the confirm key or cancel key is clicked or a confirm message is displayed after a desired menu item is selected, then it performs the TV mode at the predetermined original screen size.

The TV mode is released by clicking on an end key (power key) under the condition that the TV mode is executed. If the end key input is generated at step 733, the control unit 10 proceeds to step 735 to output a TV exit command to the video processing unit 70 and then release the TV mode.

5 As apparent from the above description, the present invention provides a mobile terminal which is capable of processing a received television video signal to display it as a television picture on a display unit thereof. The present mobile terminal can also scale up or rotate the displayed television picture, or capture and store it as a still picture. Further, when displaying the television picture, the mobile
10 terminal can efficiently control memories to process the received video signal in real time. Furthermore, the mobile terminal can process a television mode in a menu manner, resulting in an increase in the convenience of television watching.

Although the embodiments of the present invention have been disclosed for illustrative purposes, those skilled in the art will appreciate that various
15 modifications, additions and substitutions are possible, without departing from the scope and spirit of the invention as disclosed in the accompanying claims.
